Your Lawn Comes First

Nothing will add to the appearance and, for that matter, actually enhance the value of your home to such a degree as a well-made, well-kept lawn. It makes the most appropriate setting for trees, shrubs, and flowers, and helps to make a house "home."

A good lawn, one that will stay green through the drought of midsummer and maintain a compact, smooth, velvety green surface year in and year out, is easily made.

SOIL AND PREPARATION. The ideal lawn soil is a well-drained, moderately rich and moderately heavy loam. If raw subsoil has been exposed in grading, cover or replace it to a depth of 8 inches with top soil from an old meadow or garden. If the soil is too sandy, add manure or prepared humus to act as a binder and moisture holder. If it is stiff clay, add sand or ashes to make it lighter, and manure to make it mellow. Avoid fresh stable manure, as it is almost invariably full of weed seeds. Pulverized Sheep Manure is excellent. Spade up the soil to a depth of 6 to 8 inches, mixing in the manure or other fertilizer, and then rake the surface as fine and level as possible.

SEEDING. Sow the seed evenly over the surface. To insure a thick, even stand, use plenty of seed; an excessive quantity will do no harm. It is a good idea to divide the seed in half and go over the plot twice, making the second sowing at right angles to the first. Then go over the surface with a roller to compact the soil about the seed. Make the first cutting when the young grass is 3 to 4 inches high.

In shady places sow Shadyland Lawn Seed and give extra attention to fertilizing and watering, as trouble under trees and shrubs is more often due to the fact that their roots have absorbed all food and moisture from the soil, than to their shade.

WATERING. If the soil contains plenty of moisture-retentive humus, little artificial watering should be required. If it becomes necessary to use the hose during the dry spells, an occasional thorough soaking is better than frequent light sprinklings.

RESEEDING. Even on well-established turf it is advisable to scatter seed every Spring and Fall. One-third to one-half of the quantity recommended for seeding a new lawn is generally sufficient for this purpose. Bare spots on old lawns should be dug up, well fertilized and re-sown. Thin places need only be scratched up with the rake, seeded, and rolled.

OUR LAWN SEED MOTTO—"HIGHEST QUALITY—REASONABLY PRICED"

Good Morning!

Not to a new day but to a new gardening year. In February when you first notice that the days are beginning to lengthen, if you are a gardener, and who at heart is not, your thoughts will turn to that spot of earth you call your own, then subconsciously you will commence plotting it out into beds and rows of fragrant flowers and luscious vegetables. So we say again, "Good Morning" to a new gardening year and may it prove a bounteous one.

When you come into our store for the first time on the approach of Spring, we will personally greet you "Good Morning," and not as a mere phrase but with a world of meaning in it, for we are all gardeners together engaged in the most essential industry in the world.

From a small beginning we have grown to serve thousands, but we will never grow so big that each and every customer's smallest gardening problem is not a subject for the most careful consideration. There are times in the Spring rush when we cannot give as much time to each customer as we would like, but

we are sure that you will be as promptly and as courteously served as is humanly possible.

TO OUR MAIL ORDER CUSTOMERS. Unfortunately we cannot greet you "Good Morning," by word of mouth, when we receive your order, but the spirit is there and we know you will feel it when you receive our acknowledgement as promptly as the U. S. Mail can deliver it, and close on the heels of the acknowledgement, your order itself, carefully and neatly filled and packed by practical gardeners.

Old-Fashioned Sweet-Scented Mignonette.

Old Time Flowers

This year, instead of calling to your particular attention flower novelties, we suggest that you try some of the old time favorites and feel sure that you will be as delighted in finding new beauties in them as you have been in the past in realizing your expectations in the newest of the new.

571 Ageratum, Tall Blue

Practically all flower gardeners know the Dwarf Blue Ageratum so largely used for borders, but far too few know the Tall variety and its charming qualities. Tall Blue Ageratum is 18 to 20 inches high. Stems are long and straight and flower heads are that light clear Delphinium blue so seldom found in the annual flowers. Pkt., 10c; ¼ oz., 25c.

633 Amaranthus Tricolor Splendens

With foliage as brilliantly colored as the Christmas Poinsettia, Amaranthus Tricolor is an ideal plant for the garden artist. It is most effective in the Rose garden in mid-summer and can be used to advantage in both perennial and shrubby borders. Height, 2 feet with leaves gorgeously splashed crimson, scarlet and yellow. The flower itself is inconspicuous. Pkt., 10c; ¼ oz., 30c.

Giant Single Asters

We are determined to have you give this fine annual a trial. Last year we listed it as a novelty because it was so old as to be new again, but here we list it in its proper place and setting as an old time favorite. We call your attention particularly to the red Marshal Joffre, a bunch of which in our window last summer caused as much comment and inquiries as the finest Dahlia.

912 Marshal Joffre. Red. 913 White.
911 Lavender. 920 Mixed.
Each, pkt., 10c; ¼ oz., 50c.

Chrysanthemum

1300 Single Annual Mixed

Painted daisies is the common name but who would paint a daisy. They are Daisies, not painted, but colored with exquisite blendings of creamy-yellow and autumn bronzes. Height 2 ft. and a cut flower par excellence. Pkt., 10c; oz., 40c.

Marigold

2172 Legion of Honor

A colorful dwarf border plant that blooms from midsummer until frost. Flowers are a rich mahogany brown with yellow lights and practically cover the plants from top to bottom. Pkt., 10c; ¼ oz., 30c.

Mignonette

2225 Sweet Scented

Not the new tall stiff spiked variety, but the old graceful, airy kind that more than makes up in fragrance what it lacks in size. Pkt., 10c; oz., 35c.

Salpiglossis

Painted Tongue

This will prove a new flower to many modern gardeners but it was dear to the hearts of our grandmothers. Graceful plants about a foot and a half tall that bear Nasturtium-like flowers on long stems in shades of red, purple and white, all delicately veined with purest gold.

2651 Crimson. 2654 Scarlet and Gold.
2652 Purple and Gold. 2655 White and Gold.
2653 Rose and Gold. 2660 Choice Mixed.

Each, pkt., 10c; ¼ oz., 50c.
2659 Collection: One pkt. of each of the above 5 colors. 40c.

Scabiosa

Mourning Bride or Pincushion Flower

The first common name we cannot account for but the latter is very descriptive as the flowers greatly resemble small pink, lavender, maroon and red pincushions with silver white pins stuck in them. Height, 18 inches and excellent for cut flowers.

2701 Black-purple. 2704 Lavender.
2702 Crimson. 2705 Rose.
2703 Flesh-color. 2706 White.

2710 Mixed.
Each, pkt., 10c; ¼ oz., 30c.
2709 Collection: One pkt. of each of the above 6 colors. 50c.

OLD TIME FLOWER COLLECTION

One packet of each of the above eight Old Time Flowers (the Mixture will be sent of those varieties offered in separate colors unless a specific color is requested). 70c, postpaid.

Rock Gardens

Rock gardening is perhaps the most fascinating phase of gardening. It presents all the problems of larger landscape plantings on a small scale and, if well worked out, can be made a source of pleasure from early spring until late fall.

The Rock Garden may be either in full sun or partial shade but it should be located where it can be easily watered in case of need.

Remove the soil to a depth of 12 inches saving only the good top soil. Fill in the bottom with 6 to 8 inches of coarse ashes or rubble for drainage. Rocks should be unequal in size and shape and so placed as to leave numerous earth pockets for the plants. Do not place them too symmetrically and have at least one high spot.

Mix the top soil with one-third leaf mould, peat moss or decayed vegetable matter to make it porous and use this mixture for filling in between the rocks.

Although a perennial Rock Garden is the ultimate goal, we would suggest using annuals, with which very pleasing effects may be had, the first year; growing the perennials along in a seed bed for transplanting in the fall.

We have only included the dwarf and medium dwarf varieties in this list although quite a few of the taller sorts can be worked in to advantage as background.

Full descriptions of the varieties listed will be found in the flower seed section.

Alpine Rock Garden Collection

An imported collection consisting of twelve of the finest Alpine plants suitable for Rock Gardens. All are perfectly hardy.

The following are included in this superb collection:

ANEMONE pulsatilla.
ALYSSUM sax. atrinum.
CAMPANULA speciosa.
DIANTHUS pungens.
ERYNGIUM alpinum.
HELIANTHEMUM apenninum.
LINUM perenne.
MYOSOTIS, Ruth Fischer.
PRIMULA japonica.
SAPONARIA ocymoides.
SAXIFRAGA decipiens.
VIOLA bosniaca.

Most of these varieties are the rarer sorts which we do not catalog and therefore cannot be supplied separately but only as a collection. Price, \$2.50, postpaid.

Fresh From Your Own Garden

There is all the difference in the world between vegetables fresh from your own garden and fresh from other sources. Fresh in some cases may mean a week and even from the farmer markets means at least a day old.

It has long been known that the food value of fresh vegetables decreases steadily from the time they are picked until they are cooked, so that in order to enjoy their complete tastiness and get the full benefit of their health-giving properties, you must grow your own. And "growing your own" is not all hard work, for there is a lot of pleasure in watching the various plants develop, in harvesting and finally in eating the fruits of your labor.

Soil. Rich acres are not necessary in order to have these delicacies from your own garden. Any soil that can rightfully be called soil can be made to grow the finest vegetables. The ideal soil is sandy loam, rich in humus (decayed vegetable matter) and well drained. Heavy soils are greatly improved by an application of lime, and light soils by digging in cover crops (such as cow peas, rye, etc.), or large quantities of strawy manure.

Pulverized sheep manure is an excellent all-around fertilizer for gardens. It is high in available plant food, contains humus, and is absolutely free from weed seeds. Dig in at the rate of five pounds to fifty square feet. For root crops (beets, carrots, etc.), put a little bone meal in the drill and cover lightly with soil before sowing seeds. For leaf crops (cabbage, lettuce, etc.), use a small quantity of nitrate of soda from time to time during the growing season. This quickens the growth and produces larger plants.

Preparation. Prepare the ground as early in the Spring as it will crumble on the spade

or fork. If top soil is deep, spade to a depth of 8 to 10 inches; if shallow, dig all the top and just a little of the bottom soil and mix thoroughly. After spading, break up the lumps with a steel rake and make your garden as level as possible. Then mark out your rows.

Planting Dates. Due to changing weather conditions and differences in localities, we cannot give definite dates to plant. As a general rule, however, all the hardy vegetables (beets, carrots, lettuce, smooth peas, etc.), may be planted outdoors as soon as the ground can be worked; tender varieties (corn, cucumbers, wrinkled peas, etc.), about when the maple trees start to leaf.

Thin Out. We could venture to state that more gardens are spoiled by lack of proper thinning out than from any other cause. Thin out as soon as the plants are big enough to handle (see cultural instructions preceding each variety for distances). Plants thinned out need not be wasted, for the majority of vegetables transplant very easily and even if they must be thrown away, it is better to have a dozen good plants that will yield than fifty poor ones that will not.

Cultivation. This takes you up to the cultivation and watering of your garden. Cultivate frequently, not only to keep down weeds but to conserve moisture. Water only during extreme droughts and be sure to thoroughly soak the ground.

Do not permit any ground to remain idle after taking off an early crop. Plant something immediately, if only a cover crop to turn under.

Full cultural directions are given throughout the catalog immediately preceding each variety. We will be glad to furnish additional instructions on request.

B. S. & B. Co's. Quality Vegetable Seeds

The varieties of Vegetables listed on the following pages are our personal selections, backed by years of experience in supplying quality seeds to the private and professional gardener.

The list of varieties is very comprehensive and will be found to include the recognized standard sorts as well as the newer varieties that have proven their worth.

This extensive list gives ample opportunity for you to select the varieties best suited to your particular needs and climatic conditions, which is not the case when your selection is limited to a few varieties.

VEGETABLE SPECIALTIES FOR 1927

The varieties listed here represent the most recent introductions and improved strains and should be included in every garden. All have been thoroughly tested in our Trial Garden, and as a result of these trials, we can highly recommend them to both amateur and professional gardeners.

Fordhook Bush Lima Beans

Lack of space for poles need no longer deprive you of this fine late Summer and Fall vegetable. A row 20 feet long gives a goodly supply, while a row 40 feet long is plenty for a family of four. Plants are of dwarf, bushy growth and yield quantities of large, fat beans, 4 or 5 to a pod. Pkt., 10c; pt., 40c; qt., 80c; 2 qts., \$1.50; pk., \$5.25.

Crosby's Special Egyptian Beet

An exceedingly fine type of this all-purpose Beet. Crosby's Special is of very rapid growth, with small tops. Roots are rather deep turnip-shaped, blood-red, and of the very finest quality. Pkt., 10c; oz., 20c; ¼ lb., 50c; lb., \$1.50.

Penn State Danish Ball-head Cabbage

A very superior strain of the Short-Stemmed Danish Ballhead Cabbage. Heads are extremely solid, almost globular in shape, and on average soil will weigh from 4 to 6 pounds. Stems are short. Due to the uniformity of heads and blight resistance will outyield the old types. This fine new variety is very resistant to Cabbage diseases, particularly to black-leg. Pkt., 25c; ½ oz., 65c; oz., \$1.00.

Barden's Wonder Bantam Sweet Corn

Imagine an ear of Corn 8 to 9 inches long with 10 rows of deep, buttery yellow grains having all the sweet, luscious flavor of the long-famous Golden Bantam, and you have drawn a mind picture of Barden's Wonder Bantam. To really appreciate its quality you must grow and eat it yourself. Pkt., 10c; pt., 30c; qt., 55c; 2 qts., \$1.00; pk., \$3.00.

Three Weeks Forcing Radish

Three Weeks Forcing Radish is just as the name implies, a Radish that is ready for the table in three weeks from sowing. The tops are very small and the roots medium size, bright scarlet in color and the finest quality imaginable. Plant a row in your garden and surprise your friends. Pkt., 15c; oz., 25c; ¼ lb., 75c.

Marglobe Tomatoes.

Marglobe Tomato

For years many gardeners have thought that the Globe Tomato could not be improved upon. But here is an improvement and a real improvement, not merely a change in name. This wonderful new variety has all the good points of the Globe with the addition that it is blight resistant, and is not so inclined to split in wet weather. Pkt., 25c; ½ oz., 55c; oz., \$1.00; ¼ lb., \$3.50.

Supreme Green Cucumber

A grand new variety of the Davis Perfect type. Plants are very vigorous, with rich dark green foliage and very resistant to blights. Fruits are dark green, tapering slightly to the ends. Fine for large fruits or pickles. Pkt., 10c; oz., 25c; ¼ lb., 75c.

ASPARAGUS SEED

An Asparagus bed can be started either from seed or roots. Sow seed early in the Spring, $\frac{3}{4}$ inch deep, in rows $1\frac{1}{2}$ feet apart; thin out the plants to 6 inches apart. Transplant the following season as given under roots.

One ounce of seed will sow 50 feet of row.
Giant Argenteuil. Purple tinted stalks. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 50c; lb., \$1.25.

Palmetto. Large green stalks. Pkt., 10c; oz., 20c; $\frac{1}{4}$ lb., 50c; lb., \$1.25.

Washington Rustproof. A new rust-resistant, heavy-producing Asparagus from the U. S. Department of Agriculture. Of rapid growth, large size, and very tender. Pkt., 15c; oz., 35c; $\frac{1}{4}$ lb., \$1.10; lb., \$4.00.

Asparagus Roots

An Asparagus bed is permanent, so that much care should be taken with its preparation. The bed should be on well drained ground, heavily manured and spaded $1\frac{1}{2}$ to 2 feet deep. Place roots in trenches 1 to $1\frac{1}{2}$ feet deep and cover with 3 inches of soil. As the shoots come up, pull in soil from the sides from time to time until the bed is level. No Asparagus should be picked until the third year and then only sparingly. The bed should not be cut over after the first week in July, as the roots must have some time to store up strength for the following year. Top-dress each Fall with manure, which should be dug in early the next Spring.

Palmetto and Giant Argenteuil. 2-yr. roots. Bundle of 50, \$1.00; \$1.75 per 100; \$12.50 per 1000.

Washington Rustproof. 2-yr. roots. Bundle of 50, \$1.50; \$2.50 per 100; \$20.00 per 1000. If wanted by parcel post, add 10c per 100.

Washington Asparagus.

Brussels Sprouts.

Artichoke

One of the vegetable aristocrats and well worth growing if you care for something "different." Edible portion is the large, thistle-like head. If started indoors very early will bear first year. Use same culture as for early cabbage, and, as Artichokes are perennial, plant where they need not be disturbed.

Large Green Globe. The standard variety. Pkt., 25c; oz., 75c.

Artichoke Plants. Ready in June.

Broccoli

Quite similar to cauliflower but will produce fine heads in localities where cauliflower cannot be successfully grown. Same culture as cabbage.

White Cape. Large creamy white heads. Pkt., 10c; $\frac{1}{4}$ oz., 25c; oz., 75c.

Brussels Sprouts

A delicious and easily grown Fall vegetable, and one of the few that may be enjoyed in late Fall after frost has killed the less hardy kinds. Produces miniature cabbage heads at the base of each leaf. Use same cultural directions as for late cabbage, and when the sprouts commence to form, break off the lower leaves.

Long Island Half Dwarf. Covered with tender sprouts of good flavor. Pkt., 10c; oz., 35c; $\frac{1}{4}$ lb., \$1.10.

INFORMATION

How many times have you regretted not marking the different varieties at time of planting? Much can be put on small wood labels, such as variety, date planted, etc. See page 76.

DWARF or BUSH BEANS

Bountiful Beans.

Grow Bush Beans in your garden and get more meals per square foot. They are easy to grow, thrive in almost any soil, and produce big crops in little space. The seed should not be sown until danger from frost is past. Sow in rows $1\frac{1}{2}$ to 2 feet apart, dropping the seeds 4 inches apart, and covering 2 inches deep. Cultivate frequently but do not work around the plants while they are wet, lest they "rust." Pick the pods before they are fully developed and the plants will produce several good pickings. For a continuous supply, make successive sowings every two weeks up to mid-July. Plenty of pulverized sheep manure and watering in the dry spells will greatly increase the yield. Apply water to the soil between the rows, not to the foliage.

One quart of Beans will plant 100 ft. of row.

If wanted by parcel post, add 8c per pt.; 10c per qt.

Green-podded Bush Beans

Green-podded Beans are preferred in local markets, although, except for color, there is really very little difference between them and the yellow-podded sorts.

Burpee's Stringless Green Pod. One of the first to bear; hardy, productive and always perfectly stringless. Pods round and thick, averaging 5 inches in length. A favorite for the home garden. Pkt., 10c; pt., 30c; qt., 60c; 2 qts., \$1.10; pk., \$3.75.

BOUNTIFUL. A remarkably prolific and continuous bearer; reliable even under unfavorable conditions and largely grown for first crop in both home and market gardens. Delicious Lima Beans

The late Summer and Fall vegetable supreme. Their food value is twice that of milk and their savoriness second to none. A light soil suits them best, and the seed should not be planted until the weather is warm and dry. The bush varieties bear earlier and require less space, while the pole varieties produce larger crops. Spray with Bordeaux Mixture as a preventative for mildew.

Bush Lima Beans

More hardy than the pole varieties and therefore may be planted earlier. Make rows 2 feet apart and plant the Beans, eyes down, every 2 to 3 inches. Cover about 2 inches deep. Thin to 6 inches.

One quart of Lima Beans will sow 100 feet of row.

If wanted by parcel post, add 8c per pt.; 10c per qt.

Treat your Beans with Farmogerm for bigger and better crops. See page 71.

(See page 23).

Crosby's Egyptian Beet.

GARDEN BEETS

Beets are easily the favorite of all root crops. Best results are obtained in well drained, loamy soil, although any soil will do if it is deeply dug and cultivated frequently. Sow as early as the ground can be prepared, in rows 1½ feet apart, 1 inch deep, pressing the soil down firmly over the seed. When large enough to use as Beet greens, thin out to 2 inches apart. A continuous supply can be had throughout the season by sowing seeds every two weeks up to early August. Make a liberal planting in July to provide roots for Winter use. Beets stored in a cool cellar, covered with slightly moist earth or sand, will keep their tenderness and flavor all Winter.

One ounce of seed will sow 50 feet of drill.

Beets All Winter

Late sown Beets may readily be kept for Winter use, if packed in slightly moist soil or sand in a cool cellar. We recommend Detroit Dark Red for this purpose.

Early Jersey Wakefield Cabbage.

CABBAGE

To grow good Cabbage, a fairly rich soil and plenty of moisture are required. Apply an abundance of manure or other fertilizer high in humus and nitrogen.

For early crop, start the seed in a hotbed or seed-flat indoors in January or February, transplanting to another bed or flat when the second pair of leaves appear; harden the plants off by exposing them more and more as the weather becomes warmer and set them out in the garden as soon as frosts are past. For second-early crop, sow in March or April and set out in May; for late crop, sow in May and transplant in July. Set Cabbage in rows $2\frac{1}{2}$ to 3 feet apart and space the plants $1\frac{1}{2}$ to 2 feet in the rows. Cultivate frequently and make several applications of nitrate of soda during the growing season. Insecticide soaps and Slug Shot are good remedies for Cabbage pests.

One ounce of seed will produce 3000 plants.

For early crop, sow the short-rooted varieties from the first to the middle of April, in rows 12 inches apart, and cover about $\frac{1}{2}$ inch deep. For main crop, sow up to the middle of June in rows 15 to 18 inches apart. Thin out the plants to stand 3 to 4 inches apart. Carrots may be kept for Winter use in the same manner as beets. CAULIFLOWER

Cauliflower is, in our opinion, the finest flavored of all the cabbage family and may easily be grown in the small garden, providing the soil is moderately rich.

For early crops sow the seed in the hot-bed by the middle of February, transplanting later to a cold frame and setting out in the garden in late May, 6 inches apart, in trenches about 10 inches wide, 6 inches deep and 4 feet apart. For late Celery, sow in March or April and transplant to trenches in late June or July. As the plants attain full size, gradually draw up earth on both sides to blanch them and bring out the flavor. Use Bordeaux Mixture as a rust preventative.

Barden's Wonder Bantam Corn—A Giant Golden Bantam and Just as Sweet.

SWEET CORN

Sweet Corn is the favorite crop in most American gardens, and one of the easiest to grow. A deeply dug, moderately rich, well drained soil will give best results. Wait until soil and weather are warm before sowing; the middle of May is generally safe for the yellow varieties and two weeks later for the whites.

Sow in rows $2\frac{1}{2}$ to 3 feet apart; scatter seeds 3 to 4 inches apart and cover 2 inches deep, later thinning out to 1 foot apart in the rows. Corn is also grown in hills 3 feet apart each way for horse cultivation, leaving three strong plants in each hill. Frequent shallow cultivation is important—more necessary with Corn, perhaps, than with any other garden crop.

For succession, make sowings every 10 days up to July 15. To insure good pollination and well filled ears, grow Corn in several short rows, side by side, rather than in one long row.

One quart of seed will plant 200 hills, or 400 feet of row.

If wanted by parcel post, add 8c per pt.; 10c per qt.

Yellow Varieties

Golden Bantam. A universal favorite. May be planted as early as May 1st. Dwarf growing; matures in 60 days; ears 5 to 6 inches long with 8 rows of broad, yellow kernels of unsurpassed flavor. Pkt., 10c; pt., 25c; qt., 50c; 2 qts., 90c; pk., \$2.75.

Retaining all of the sweetness and rich flavor of that variety, it produces ears 3 inches longer and a little larger in diameter. Prolific, extra early, ideal in size; will become one of the most popular Sweet Corns in cultivation. Pkt., 10c; pt., 30c; qt., 55c; 2 qts., \$1.00; pk., \$3.00.

DeLue's Golden Giant. A splendid hybrid sort with the color and quality of Golden Bantam and the size of its other parent, Howling Mob. Nearly as early as Bantam. Pkt., 10c; pt., 25c; qt., 50c; 2 qts., 90c; pk., \$2.75.

CUCUMBERS

Cucumbers thrive best in a rich, warm, loamy soil, and planting should be delayed until settled warm weather. Make hills about 4 feet apart each way and thoroughly mix into the soil well-rotted manure to a depth of 6 inches or more. Scatter 12 to 15 seeds to a hill and cover one inch deep; thin out to 3 or 4 of the strongest plants after danger of insects is over. Dust the young plants with Slug Shot to kill the beetles and worms.

One ounce of seed will plant about 50 hills.

LETTUCE

Dig the soil deeply for Lettuce, using plenty of manure or nitrogenous fertilizer, and adding sand or humus if the soil is heavy. For a very early crop, start seed indoors or in a hotbed in early March, thinning or transplanting the seedlings as soon as they are large enough to handle; harden them off and set them out in the garden in early April. The first sowing outdoors may be made as soon as the ground is fit. Make the rows 15 to 18 inches apart and thin the plants out as they develop, so that they eventually stand 10 to 12 inches apart. Timely thinning and plenty of room is especially important in growing Head Lettuce. For the first crops grow Loose-Leaf or Early Butterhead varieties; follow these with the late Butterheads; and for hot weather use, grow the Crisphead or Cos types.

One ounce of seed will sow 150 feet of drill.

Sow 10 to 12 seeds in each hill, in late May, and, after danger of insects is over, reduce to 3 or 4 plants in a hill. Fight the insects by dusting the young plants with Slug Shot and spray the vines with Pyrox. Many old gardeners plant a few radishes in each hill to keep away insects.

Parsnips require a deeply dug but not necessarily rich soil. The largest and smoothest roots are grown in light, mellow soil, free from stones. Fresh manure causes rough and misshapen roots. The seed should be sown as early as the ground is fit—never later than mid-May. Make the rows $1\frac{1}{2}$ feet apart and cover the seed about $\frac{1}{2}$ inch deep. Thin out the plants to stand 4 to 5 inches apart. Give frequent deep cultivation. The flavor of Parsnips is improved by frost. ONIONS

A fine, prepared, mellow soil, well fertilized, is needed to grow good, large Onions from seed. As early in the Spring as the ground can be worked, sow the seed in drills 15 inches apart and cover $\frac{1}{2}$ inch deep. When the seedlings are 3 to 4 inches high, thin or transplant them to stand about 3 inches apart. Hoe frequently to keep the soil loose but do not draw it around the bulbs. For extra large Onions, start the seed in the hotbed in late February or March and transplant to the garden in April.

One ounce of seed will sow 100 feet of drill.

White Portugal Onion.

Onion Sets

Onion Sets are produced by sowing seed very thickly and not thinning out. They are the quickest method of producing green bunch Onions in early Summer and if planted 4 to 5 inches apart will produce good Onions for late Summer or Fall use. Onions produced from sets do not keep well over Winter and for this purpose it is better to sow seed.

PARSLEY

Sow in early Spring in rows 1 foot apart and cover firmly $\frac{1}{4}$ inch deep; thin out to 6 inches. Market Surprise Peas.

GARDEN PEAS

There are two classes of Peas, the smooth-seeded kinds, which are very hardy and may be planted as early in the Spring as the ground can be prepared, and the wrinkled Peas, which are less hardy but much better in quality. Wrinkled Peas should not be sown much before mid-April.

Sow in drills about 3 feet apart and 3 inches deep. Tall-growing kinds may be grown in double rows, allowing 6 inches of space between in which to place brush or trellis to support the vines. All Peas do best on a fairly heavy soil which holds plenty of moisture, although the dwarf kinds will give good results on a light soil, providing it is moderately rich.

By planting one or two varieties of smooth-seeded Peas as early as possible and then a selection of wrinkled sorts that will mature in succession, a constant supply of tender green Peas may be had. Varieties are listed in the order in which they mature. One quart of Peas will sow 100 feet of row.

If wanted by parcel post, add 8c per pt.; 10c per qt.

Beauty Tomatoes.

TOMATOES

Sow the seed in late February or early March, in the hotbed or a box indoors placed in a sunny window. When the plants are 2 to 3 inches high, transplant them to other boxes or paper pots, and transplant again, if possible, when about 6 inches high, to make them stocky and stimulate root growth. Set the plants in the garden, 3 to 4 feet apart in late May. A rich, moist, loamy soil is best for Tomatoes. An occasional application of nitrate of soda will push the young plants along rapidly. Sow three or four different varieties in order to have a succession of fruit all Summer. Supporting the plants with stakes or trellis will increase the yield.

Flowers Grow Your Own

WHETHER your taste runs to great masses of brilliant color or artistic plantings of the rarer and more delicate shades, whether you want blooms to beautify your borders or to cut for vases and table decoration, you will find flower growing intensely interesting and delightful, as well as an easy and inexpensive recreation. With hundreds of easily grown varieties from which to choose (and many of the lesser known sorts are fully as beautiful and just as easy to grow as the old favorites), there is endless opportunity for creating new effects and discovering new beauties.

ANNUALS, BIENNIALS, and PERENNIALS are indicated by the letters A, B, and P, respectively, after each sort. Annuals grow, bear flowers and die in one season. Most of our common garden flowers, such as Nasturtiums, are in this class. Biennials require two years to bloom. Hollyhocks are biennials. The life of perennial flowers is not limited to one or two years but is indefinite. Some perennials produce flowers the first season, but most of them do not commence to bloom until the second season after sowing. Coreopsis is a well-known perennial.

HARDY, HALF-HARDY, and TENDER sorts are indicated by the letters H, HH, and T. Hardy varieties can stand a considerable amount of cold weather and may be sown outdoors early in the Spring, usually about mid-April. The hardy biennials and perennials require very little Winter protection. Half-hardy varieties should not be sown outdoors until soil and weather are warm, about May 15th. They will bloom earlier if the seed is started indoors in March or April and the plants set out in the garden late in May. Half-hardy biennials and perennials should be wintered in a coldframe. The tender sorts are subjects for conservatory culture, although some of them, notably the Begonias and Geraniums, may be set outdoors in warm weather.

TIME TO SOW. Biennials and Perennials, which do not bloom the first season, are generally sown in a seed-bed in June, July or August, and transplanted in late Summer to the places where they are to bloom the following season. Perennials which bloom the first season should be sown in a box indoors in February or March, and transplanted to the garden late in May.

SOIL AND PREPARATION. Flowers can be successfully grown in practically all soils. Some good fertilizer, such as well-rotted stable manure, pulverized sheep manure, or bone meal should be dug in and thoroughly mixed with the soil when it is prepared for planting. The surface should be made as fine and level as possible.

PLANTING. The first thing to remember in planting flower seeds is not to plant them too deeply. The very fine seeds such as Petunia, Snapdragon, etc., should be scattered on the surface and pressed into the soil with a flat board. Sow larger seeds in shallow drills.

TRANSPLANTING AND THINNING OUT. With but a few exceptions, notably Poppies, young flower plants may readily be transplanted, so that they may be started in a hotbed or cold-frame, or even in boxes in a sunny window, for later transplanting to the place where plants are to bloom.

As soon as the seedlings are large enough to handle they should be transplanted or thinned out to prevent overcrowding. Set plants slightly deeper than they were before lifting and be sure to firm the soil around the roots. A good rule for spacing plants in the garden is to set them apart half their full grown height; however, a distance of 1½ feet is ample space between very tall-growing plants.

Aster AHH

Aster, American Beauty.

During late Summer and Fall, Asters rule the annual garden and make the finest of all flowers for cutting. By sowing several different classes that will come into bloom at different periods, a garden of continued loveliness may be maintained from mid-July until frost. Like many other flowers, they are most effective when grown in solid beds, all of one color. For the largest plants and finest flowers, start the seed indoors or in a hotbed in March. When the plants are 2 to 3 inches high, transplant them into small pots or paper dirt-bands, and set them out in the garden in May when soil and weather are warm, 10 to 18 inches apart. The seed may also be sown outdoors in May in a finely prepared seed-bed. Cultivate frequently.

Pansies BH

Cool weather and moist soil produce the largest and finest Pansies. The best time to sow is during July or August, in shaded frames, in which the plants, given some protection, may be carried over winter and set out early the following spring when they will commence to bloom at once and continue all summer if supplied with plenty of water. Next best is to sow indoors or in the hotbed in February or March. Seed sown indoors in May will give blooming plants in the fall. Space Pansy plants at least a foot apart and keep the faded flowers picked.

Petunia AHH

Few flowers are more desirable for beds, porch-boxes, or hanging-baskets than Petunias. They are easy to grow and bloom profusely from early summer to frost. Best results are secured by starting the seed indoors in March, particularly with the Giant-flowered varieties, while the smaller-flowered bedding sorts will give excellent results if sown in May in the place where they are to bloom. Plant in very shallow drills and cover with papers or bagging to prevent washing during heavy rains.

GIANT-FLOWERED SINGLE and DOUBLE VARIETIES. Our strain of these magnificent Petunias is better than ever this year, all plants having been carefully cross-fertilized, and are of the true dwarf upright-growing type. We believe that a better strain does not exist. Seed should be started indoors and care taken that ants do not have access to the seeds as they will carry them off.

Sweet Peas AN

It is not difficult to grow fine Sweet Peas, even in our trying climate. The secret of success lies in getting an early start and, by thorough soil preparation, insuring a strong deep root-growth to keep the plants well supplied with water. If you want to grow the largest and finest blossoms, start as early in the spring as the soil can be worked—early in March, if possible.

Choose an open location and dig a trench $1\frac{1}{2}$ feet deep and a foot wide. Mix with the soil a liberal quantity of fertilizer (sheep manure with a little bonemeal is an excellent combination). Refill the trench with this mixture to within 6 inches of the top. Scatter the seed about an inch apart on this layer and cover them with 2 inches of soil. When the plants are 4 to 6 inches tall, gradually fill in around them until the top of the trench is reached. By this method the roots are secured a plentiful supply of food in the dryest spells.

The vines may be supported with brush, strings, wire or any handy form of trellis that will allow free circulation of air. Of course, good Sweet Peas can be grown without trenching, but extra attention is always well repaid with larger flowers, more of them, and a longer blooming season. Keep the flowers picked and the vines will bear longer.

We offer the best of the Spencer or Orchid-flowered Sweet Peas, these being far superior to the older Grandiflora type.

Summer-flowering Spencer Sweet Peas

We offer, this year, a completely revised list of this ever-popular flower. All the newer really worth-while varieties are included and a few of the old standbys that have defied improvement. Flowers are of huge size, gracefully waved, and are generally borne four to a stem.

New Mammoth
Dahlia-Flowered
Zinnia.

Zinnias AH

Zinnias are a great specialty with us and we take particular care to see that our stocks are the finest to be had. Our strains are grown especially for us by the originator of the famous Dahlia Flowered type, in spite of the fact that we could get them cheaper from other sources. That our care has not been in vain is proven by the hundreds of complimentary reports we received on our Zinnias during the past summer and fall.

Zinnias are justly the most popular flower of today. They are easy to grow, require no staking and for brilliant color effect cannot be equalled. Zinnias require only a sunny spot in ordinary soil and an occasional weeding to reward you with an abundance of bloom from midsummer until late fall.

Wild Garden Mixture

We have had so many calls for something in flowers that could just be scattered and raked in odd spaces to give a wild-flower-garden effect that we have made up a tall and a dwarf mixture especially for this purpose. These mixtures contain a large assortment of the various annual flowers that will grow and bloom with little or no care.

If possible, the ground should be spaded, the seed scattered and raked in; good results are, however, obtained by scratching the soil as deeply as possible with a steel rake and then scattering the seeds.

3300 **Dwarf Wild Garden Mixture.** Pkt., 10c; ½ oz., 25c; oz., 40c.

3301 **Tall Wild Garden Mixture.** Pkt., 10c; ½ oz., 25c; oz., 40c.

Decorative Dahlia.

Dahlias

The present great popularity of Dahlias is well deserved. They have a beauty and variety of form and color unequaled by any other flower and are adaptable to practically all garden schemes from a single plant in a small garden to veritable hedges in the more expansive gardens. Even beginners have wonderful results, while the more experienced gardeners are amply repaid by the additional size and beauty of blooms resulting from their expert care and attention. Dahlias are easy to grow in almost any soil, the two main requirements being plenty of sunlight and water.

PREPARING THE GROUND. Dahlias delight in a light, friable, loamy soil, enriched with well-rotted stable manure. Spade the ground full depth of the top soil and be sure that manure is thoroughly mixed with soil.

PLANTING. Tubers may be started indoors in boxes in April for later transplanting or planted outdoors from about the middle of May to the end of June. Lay the tubers flat, about 6 inches deep and 2 to 3 feet apart in the row.

GROWING. Do not permit more than two or three shoots to grow from a root, and when shoots are 2 feet high, pinch out the centers to promote branching growth.

FOR EXHIBITION. Permit only a single stem to grow from a root and cut off about half the lateral branches. Treated in this manner the plant will not only give larger flowers but they will all have full centers.

CURING AND STORING. When the foliage has been killed by Fall frosts, dig the roots, shake off as much soil as possible, and cut off all but 2 to 3 inches of the stems. Store the roots in a cool, dry place, stems down. It is not necessary to cover them with soil or ashes. We offer only standard divisions of dormant tubers.

FROM SEED. Dahlias are as easy to raise from seed as cabbage or tomatoes, and many interesting and profitable varieties may be produced. We offer seed of the choicest varieties on page 39.

B. S. & B. Co.'s Supreme Gladiolus

Anna Eberius.

Loveliest of summer-blooming bulbous flowers for cutting, and also very effective when used in mixed borders and among shrubbery. Gladiolus are very easy to grow, and, while fertile, moist soil will give best results, they will thrive and bloom in practically any garden soil.

Plant any time from mid-April to the end of June; in fact, we advise that planting be extended over this entire period, so that a succession of bloom may be had from July until frost. Plant bulbs 4 to 5 inches deep, 6 to 8 inches apart. Cultivate frequently, but not too deeply, during the growing season.

Before the ground freezes in the fall, dig the bulbs and let them dry in the sun for several days. When the tops are dry, cut them off about $\frac{1}{2}$ inch from the bulb and remove the old bulb from the bottom. Store in a cool, dry place where the temperature does not go below freezing.

Ten New and Splendid Gladiolus

If you want something out of the ordinary, something that will make your gardening friends and neighbors "sit up and take notice," you should buy at least one, and, if possible, some of all of the following varieties. Every one is the king of its class and as a whole they make a combination that is unsurpassed.

Cannas

See page 62 for complete list.

Hardy Garden Lilies

Most of the Lilies make stem roots near the surface and for this reason they should be planted among other plants or mulched with about 3 inches of lawn clippings or Peat Moss during the summer to protect the roots from the rays of the sun. Lilies are perfectly at home in the shrubbery or perennial border; however, the flower spikes should have access to the sun. Cover stem rooting kinds about three times their greatest diameter, placing a quantity of sand at the base of the bulb to insure good drainage.

Garden, Lawn and Farm Fertilizers

WHY FERTILIZERS ARE NECESSARY

Plants are constantly drawing nitrogen, phosphorous, potash and other elements from the soil, and when your farm or garden produces a crop of vegetables, flowers, cereals or fruits, a certain portion of these important plant foods are removed from the soil.

Continued planting and removing of crops would soon exhaust the supply of these necessary plant foods, were it not that by the use of commercial fertilizers, stable and barnyard manure, we are able to replenish the supply and thereby keep up the fertility of the soil.

Stable and barnyard manures are now difficult to obtain and it is only by the use of commercial fertilizers and green manures that we are able to put back into the soil, the important elements that have been removed. Owing to the fact that some crops take more of one element from the soil than others, our fertilizers are made up of special formulas for the different crops.

Prices on Fertilizer are based on delivery to the transportation company, or called for at our storehouse. If city truck delivery is desired, add drayage charges of 50c per 100-lb. sack; or 25c per 100 lbs. in lots of 1000 lbs. or over.

Adco Artificial Manure. The scarcity and cost of stable manure has made its extensive use impracticable, and the compost pile, although of undeniable value, is a long and tedious undertaking. The process of making artificial manure consists of merely making a heap of all garden trash, wetting it thoroughly and adding the bacterial powder Adco. In the course of three or four months this heap is converted by action of the growing bacteria into excellent manure. 25-lb. sack (enough for 12 wheelbarrows waste), \$2.00; 150-lb. sack (enough for a pile 10 ft.x10 ft.x6 ft.), \$10.50.

Acid Phosphate. Quick acting and valuable for grasses, grains and corn. Available phosphoric acid, 16 per cent. 100 lbs., \$2.00; 500 lbs., \$8.00; 1000 lbs., \$15.00; 2000 lbs., \$29.00.

Ashes, Unleached Hardwood. In addition to a goodly percentage of potash, wood ashes contain carbonate and phosphate of lime and magnesia, all essentia elements of plant food. Wood ashes are excellent as a top dressing for lawns and grass land and owing to their alkali power will render dry soils more plastic and likewise aid in making open porous soils more firmly bound. Use 5 lbs. per 100 square feet or 1500 lbs. per acre. 100 lbs., \$2.00; 500 lbs., \$8.25; 1000 lbs., \$15.50; 2000 lbs., \$30.00.

Bon Arbor. A concentrated quick acting fertilizer for pot plants, flower and vegetable garden and orchards. Nitrogen, 15 to 18 per cent, soluble. Phosphoric acid, 4 to 6 per cent. Potash, 4 to 6 per cent. 8-oz. can, 40c; 16-oz. can, 55c; 5 lbs., \$2.00.

Bone Meal Fertilizer. For lawns, vegetables, and roses. Acts slowly but its effects are lasting. Ammonia, $4\frac{1}{2}$ per cent; phosphoric acid, 21 per cent—equal to bone phosphate, $47\frac{1}{2}$ per cent. 100 lbs., \$3.25; 500 lbs., \$13.75; 1000 lbs., \$26.50; 2000 lbs., \$52.00.

Phosphoric acid, 21 per cent. 5 lbs., 30c; 10 lbs., 50c; 25 lbs., \$1.00; 50 lbs., \$2.00; 100 lbs., \$3.75; 500 lbs., \$15.75; 1000 lbs., \$30.50; 2000 lbs., \$60.00.

Bone Meal Flour. This grade of Bone Meal is the finest manufactured. It is ground as fine as flour and used largely for mixing with potting soil and in the greenhouse on crops such as carnations, roses, 'mums, etc. 100 lbs., \$5.00; 500 lbs., \$20.75; 1000 lbs., \$40.50; 2000 lbs., \$80.00.

Cattle Manure. Shredded and dried at a high temperature, whereby all weed seeds are killed. 100 lbs., \$2.50; 500 lbs., \$11.25; 1000 lbs., \$21.50; 2000 lbs., \$42.00.

Clay's Fertilizer. An English fertilizer used largely for forcing. 7 lbs., \$1.50; 14 lbs., \$2.25; 28 lbs., \$4.00; 56 lbs., \$7.50; 112 lbs., \$12.00.

Guano 1-9-4. Use in the Spring on lawns or pasture lands. 100 lbs., \$3.00; 500 lbs., \$10.25; 1000 lbs., \$19.50; 2000 lbs., \$38.00.

Carload prices on request.
